Neural Network Basics

LATEST SUBMISSION GRADE

100%

- 1. What does a neuron compute?
 - A neuron computes a linear function (z = Wx + b) followed by an activation function
 - A neuron computes the mean of all features before applying the output to an activation function
 - A neuron computes an activation function followed by a linear function (z = Wx + b)
 - A neuron computes a function g that scales the input x linearly (Wx + b)

✓ Correct

Correct, we generally say that the output of a neuron is a = g(Wx + b) where g is the activation function (sigmoid, tanh, ReLU, ...).

- 2. Which of these is the "Logistic Loss"?
 - $\bigcirc \; \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = max(0, y^{(i)} \hat{y}^{(i)})$
 - $\bigcirc \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = -(y^{(i)}\log(\hat{y}^{(i)}) + (1 y^{(i)})\log(1 \hat{y}^{(i)}))$
 - $\bigcirc \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = \mid y^{(i)} \hat{y}^{(i)} \mid^2$
 - $\bigcirc \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = \mid y^{(i)} \hat{y}^{(i)} \mid$

✓ Correct

Correct, this is the logistic loss you've seen in lecture!

- 3. Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and blue. How do you reshape this into a column vector?
- 1/1 point

1 / 1 point

1/1 point

- x = img.reshape((32*32*3,1))
- x = img.reshape((1,32*32,*3))
- x = img.reshape((32*32,3))
- x = img.reshape((3,32*32))

✓ Correct

4. Consider the two following random arrays "a" and "b":

1 a = np.random.randn(2, 3) # a.shape = (2, 3) 2 b = np.random.randn(2, 1) # b.shape = (2, 1) 3 c = a + b

What will be the shape of "c"?

- $\begin{tabular}{ll} \hline \end{tabular} The computation cannot happen because the sizes don't match. It's going to be "Error"! \\ \hline \end{tabular}$
- c.shape = (2, 3)
- c.shape = (3, 2)
- c.shape = (2, 1)

✓ Correct

Yes! This is broadcasting. b (column vector) is copied 3 times so that it can be summed to each column of a.

5.	Consider the two following random arrays "a" and "b":	1/1 point
	1 a = np.random.randn(4, 3) # a.shape = (4, 3) 2 b = np.random.randn(3, 2) # b.shape = (3, 2) 3 c = a*b!	
	What will be the shape of "c"?	
	 c.shape = (4, 3) c.shape = (3, 3) c.shape = (4,2) The computation cannot happen because the sizes don't match. It's going to be "Error"! 	
	Correct Indeed! In numpy the "*" operator indicates element-wise multiplication. It is different from "np.dot()". If you would try "c = np.dot(a,b)" you would get c.shape = (4, 2).	
6.	Suppose you have n_x input features per example. Recall that $X=[x^{(1)}x^{(2)}x^{(m)}].$ What is the dimension of X?	1/1 point
	$ \bigcirc (1,m) $ $ \bigcirc (m,n_x) $ $ \bigcirc (m,1) $ $ \circledcirc (n_x,m) $	
	✓ Correct	
7.	Recall that "np.dot(a,b)" performs a matrix multiplication on a and b, whereas "a*b" performs an element-wise multiplication. Consider the two following random arrays "a" and "b": 1 a = np.random.randn(12288, 158) # a.shape = (12288, 158) 2 b = np.random.randn(159, 45) # b.shape = (150, 45) 3 c = np.dot(a,b)	1/1 point
	What is the shape of c? The computation cannot happen because the sizes don't match. It's going to be "Error"! c.shape = (12288, 45) c.shape = (12288, 150) c.shape = (150,150)	
	Correct Correct, remember that a np.dot(a, b) has shape (number of rows of a, number of columns of b). The sizes match because: "number of columns of a = 150 = number of rows of b"	
8.	Consider the following code snippet: 1 # a.shape = (3,4) 2 # b.shape = (4,1) 3 4 * for i in range(3): 5 * for j in range(4): 6	1/1 point
	How do you vectorize this?	
	 c = a + b.T c = a.T + b.T c = a.T + b c = a + b 	

✓ Correct

9. Consider the following code:

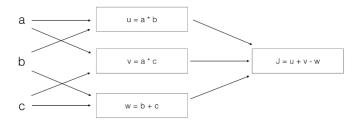

```
1 a = np.random.randn(3, 3)
2 b = np.random.randn(3, 1)
3 c = a*b
```

What will be c? (If you're not sure, feel free to run this in python to find out).

- \odot This will invoke broadcasting, so b is copied three times to become (3,3), and * is an element-wise product so c.shape will be (3, 3)
- This will invoke broadcasting, so b is copied three times to become (3, 3), and * invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3, 3)
- This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1).
- It will lead to an error since you cannot use "*" to operate on these two matrices. You need to instead use np.dot(a,b)

10. Consider the following computation graph.

What is the output J?

- $\int J = (c 1)*(b + a)$
- \bigcirc J = (a 1) * (b + c)
- $\int J = a*b + b*c + a*c$
- J = (b 1) * (c + a)

✓ Correct
Yes. J = u + v - w = a*b + a*c - (b + c) = a * (b + c) - (b + c) = (a - 1) * (b + c).
